

Salah Salah . Jarvis Consulting

McMaster University graduate in Mathematics & Computer Science with internship experience in capital markets and software development at Fidelity & HOOPP and experience in healthcare statistics research.

Skills

Proficient: Python, JavaScript / Typescript, React, PostgreSQL, Machine Learning (PyTorch, Scikit-learn), Data Structures & Algorithms

Competent: Linux / Bash, Docker, Agile / Scrum, AWS (S3, EC2, Lambda), REST APIs / Backend Development, Git / CI/CD Workflows

Familiar: Hadoop, Apache Spark, C++, MATLAB, Kubernetes, R

Jarvis Projects

Project source code: https://github.com/jarviscanada/jarvis_data_eng_SalahSalah/tree/develop

Cluster Monitor [GitHub]: Developed a Linux Cluster Monitoring system that collects and stores hardware specifications and runtime metrics from multiple Linux machines communicating over internal IPv4 networks. Designed automated SQL-based reporting scripts to support system health monitoring and resource allocation analysis.

Python Data Analytics [GitHub]: Built a Python-based data analytics pipeline using SQL and Pandas to process, clean, and analyze structured datasets. Implemented ETL workflows and generated automated reporting dashboards to extract business insights from raw data sources.

Highlighted Projects

Agentic AI Triage Service [GitHub]: Built a production-ready AI triage assistant integrating the Google Gemini API, generating real-time, structured symptom analysis via a message-driven pipeline with ~70% accuracy across diverse clinical test scenarios

Lung Diagnosis ML Model Stanford CheXpert Model [GitHub]: Trained a Convolutional Neural Network (CNN) Machine Learning Model in PyTorch to classify lung opacity from X-ray scanned images, achieving 80% accuracy and supporting early detection of respiratory conditions

Professional Experiences

Jr Machine Learning Engineer, Jarvis Consulting Group (May 2026 - Present): Working on data engineering and machine learning pipelines, focusing on building scalable ETL systems, automating data workflows, and supporting model deployment in production environments. Contribute to system design, debugging, and optimization of distributed data pipelines.

Full Stack Software Engineer, McMaster - Department of Physics & Anatomy (May 2023 - Dec 2023): Developed full-stack web applications to support academic research workflows, including data visualization tools and backend APIs. Collaborated with researchers to translate scientific requirements into functional software systems using Python, JavaScript, and database technologies.

Research Assistant, McMaster, St Joseph's Hospital (Health Research Methods, Evidence & Impact) (Jun 2023 - Dec 2023): Supported clinical and healthcare research by applying statistical analysis and data processing techniques to real-world medical datasets. Assisted in evaluating research methodologies and contributing to evidence-based healthcare studies with a focus on reproducibility and data integrity.

Private Equity Intern, HOOPP (May 2022 - Aug 2022): Conducted due diligence and financial analysis on private equity special situations investments. Built financial models, analyzed deal structures, and evaluated risk-return profiles of investment opportunities within alternative asset portfolios.

Backend Software Engineer, Quantitative Risk, Fidelity (Jan 2022 - Apr 2022): Developed backend tools and data pipelines supporting quantitative risk analysis and pricing models. Worked with large financial datasets, improving data processing efficiency and contributing to risk reporting systems used for portfolio management decisions.

Education

McMaster University (May 2025), Bachelor of Sciences, Math & Computer Science, Science

Miscellaneous

- Recreational Basketball
- Reading (Science Fiction)
- Body Building / Calisthenics
